

Diffusion Lag by Quadrant — only HRLT & HRHT have defined lags (29/886 topics)
Red zone = research leads training (course update needed); green zone = training uses already-cold content. Statistics in panel below.

HRLT vs HRHT: Welch t = +2.11, p = 0.054 (ns); Mann-Whitney p = 0.095 (ns); Cohen d = +0.78 (large effect, but HRHT n=5 is underpowered)
=> HRLT positive lag is larger on average (research→training direction); not significant at α=0.05 with n=5 vs 24.

How to read: box = Q1–Q3, bold line = median, diamond = mean, whiskers = 1.5·IQR, dots = individual topics. Lag > 0 = paper side hit 20% threshold FIRST (research frontier leads training). Lag < 0 = project side hit first.
v0.9.1 CORRECTION: LRHT (10 topics) and LRLT (698 topics) by construction NEVER cross the 20% threshold on their 'low' side, so lag CANNOT be defined — the old 12K-pool figure reporting 'LRHT med = -1.5 yr' was fabricated from legacy K=307 data and is RETRACTED.
